223 05 068 64

Legende:

- ① bräunlich mittel- bis dunkelgrauer stark sandiger Lehm mit feinkörniger Beimengung z.T. Keramik / Keramiksplit, partiell dunkel fleckige Bereiche fest verbacken u. polygonale Rissnetze
- ② dunkelbraun grau bis schwarzlich, reich verändert durch Feuerwirkung (Verfärbung) = Lehmausbruch Feuerstelle
- ③ Ziegel stark verwittert
- ④ Ziegel (Maße: ~21 x 48 cm; Stärke: 6,5 cm)
- ⑤ Steinblock (grobhauener Dolomit)

Beschreibung: eckförmig angelegte Stein- u. Ziegelfassung, aufliegend auf verziegeltem Lehmausbruch, welcher in seiner Ausdehnung über die Einfassung unregelmäßig hinausreicht z.T. erkennbar entlang der Stein- u. Ziegelfassung hochgezogener Lehmausbruch. Im N ist die Einfassung unterbrochen entweder bewusst offengelassen od. gestört. Bei dem Ziegelmateriel handelt es sich um sehr weichgelblichbraunes Material. Ausdehnungsmaße Stein/Ziegelfassung: 0,80 x 0,60 m; Mächtigkeit Ziegeloberkante bis ok Lehmausbruch: ~0,05 m. Des weiteren ist noch zu erkennen, daß das Ziegelmateriel z.T. in Lehmausbruch (Flurdehle) eingebettet ist.

dwg 1

Fireplace

Legend:

1 Brownish middle to dark grey, very sandy clay with a light proportion of fine gravel, partly pottery and crumbled pottery, partly dark irregularly coloured and baked, polygonally crazed structures

2 Dark brown grey to blackish solid area, effects of fire (burnt clay), fireplace smeared with mud

3 Burnt brick, heavily weathered

4 Brick (21 x 18 x 6.5 cm)

5 Stone block (rough hewn dolorite)

6 Light brownish grey, compacted sand with small amount of fine gravel, crumbled brick

Context description:

Roughly quadratic stone and burnt brick structure built on fine layer of fired clay which was applied beyond the framing base in an irregular fashion. This is partly recognizable along the interior edge of the natural stone where the clay has been smeared in an upward direction. On the north side the feature either has been left open or is disturbed. The brick used is burnt at a low temperature. Exterior dimensions of the stone/brick feature: 0.60 x 0.80 m; Depth of the brick upper edge up to the upper edge of the applied clay: c. 0.05 m. Furthermore, not recognizable the brick is partly embedded in the clay.

Pottery - Detail

Planum  
M 1: 10  
Drawing No. 2

12.11.2001  
Z. P. M. Jacobs

Legende:

- ① hellgrau-brauner, gefleckter feinsandiger Lehm, Lehm-Eisenhydroxid-Ausfällungen, vermischt HK, verfestigte Lehm
- ② mittelgrau-brauner feinsandiger stark mit Feinkies-durchsetzter Lehm, HK, verfest. Lehm (Graufärbung durch Sauerstoffe? Pseudoverfestigung?), verfestigt

Beschreibung: Keramikkonzentration (verm. vordrückt. Gefäß); kein direkter Hinweis auf Befundzusammenhang im Hinblick sedimentäre Verfärbungsspuren erkennbar. Jedoch unmittelbar unterhalb der Scherben, welche einen verwesenen, z.T. verchliffenen Eindruck vermitteln, zeichnet sich der sedimentäre Untergrund dunkelgrau, schwach abgegraben, von der weiteren Umgebung ab. Ausdehnungsmaß der Hauptkonzentration: 0,60 x 0,45 m.

Trench 1, spit 7, pottery

Legend:

1 Light greyish brown, heterogeneous fine sandy clay, inclusions of iron oxide and specks of charcoal, burnt clay

2 Middle greyish brown burnt clay (grey discolouration resulting from waterlogging?), fine sandy with heavy proportion of fine gravel, charcoal, compacted

Context description:

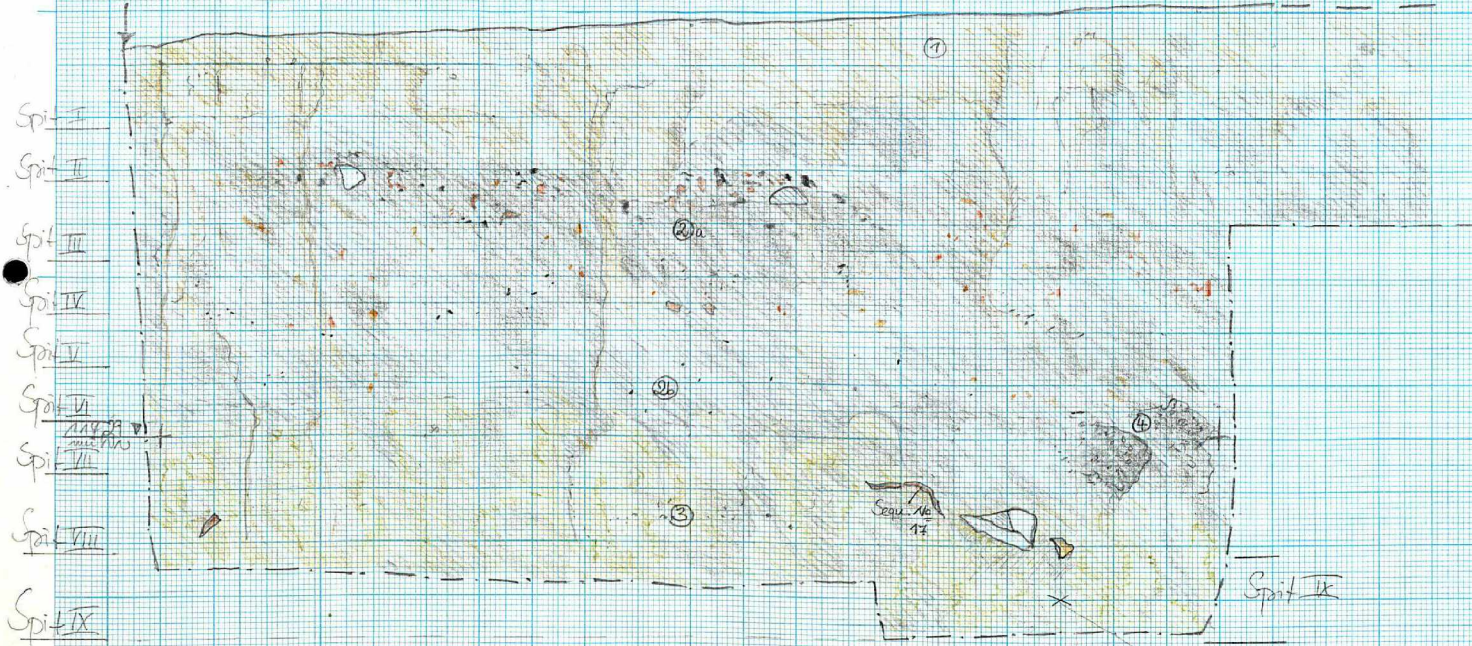

Concentration of pottery sherds presumably of a crushed vessel. Cohesiveness of context not verifiable with regard to sedimentational discolorations. However, directly beneath the sherds, partly of an abraded and tumbled appearance, the sedimented dark grey lower layer contrasts slightly with the adjacent area. The area of the main concentration measures 0.45 - 0.60 m.

Legend:

1 Light brownish grey, fine sandy slightly clayey topsoil

2a Dark greyish brown, fine to middle sandy & clayey mud, heterogeneous, highly compacted, isolated fine to middle amount of gravel, iron oxide specks, manganese, charcoal, crumbled pottery which is waterlogged

2b Middle greyish brown, fine to middle sandy and clayey mud, similar to 2a, however, somewhat lighter, lesser proportion of charcoal and pottery

2c Row of pebbles; pebbles in more or less uniform size (sorted) in one layer

3 Light greyish brown fine to middle sandy and clayey mud, iron oxide specks, isolated particles of charcoal, pottery sherds usually from the greyish areas

Planum 1

M 1:20

29.11.2001

Janine B. B.

Plan/prof dug OR01 - VII 26

④ Recht homogener, feinsandiger Lehm hell gelblich-braun. Wenige Scherben, meist Kleinstückig. Mit Seq. Nr. 13 bezeichnet eine an der Oberfläche von Spit III entnommene <sup>14</sup>C-Probe.

⑤ Inhomogener, meist fest verbackener Lehm, orange-braun bis rot. Zahlreiche, oft großstückige Scherben in mehreren Konzentrationen sowie drei in situ kollabierte Pithoi (Seq. Nr. 18, 20, 21). Auf Liegend der Eisen nagel 19, bis in Spit III hineinreichend das Eisenobjekt 17. Die Farbe des Lehmes sowie etliche verziegelte Lehmbröckchen und Schlackestücke deuten auf ein Brandereignis hin. In der SW-Ecke sind sowohl innerhalb als auch außerhalb der Pithoi extrem fest verbackene Bereiche eines hellgräulichen Lehmes vorhanden. In der Fläche, besonders aber innerhalb der Pithoi finden sich auch stellenweise auffallen harte, rötlich-braune Lehmzonen mit zahlreichen Eisenkonkretionen.

Planum 8

4.12.2001

Jonas Riemann, Peter Ditt

A gelber lockerer Sand mit etwas HK und wenig Rotlehm. Darin Flecken von rotbraunem Lehm. Konnte trotz des auffälligen Umrisses nicht als Grube bestätigt werden.

B Rotbrauner sandiger Lehm mit reichlich HK und Rotlehm, mittehart.

C M. Hellbrauner, stark sandiger Lehm mit recht kleinteiligen HK- und Rotlehmbröckchen. Keine klaren Grenzen zu B.

D braun-orange angeriegelter Lehm, sehr weich und bröckelig. Liegt auf dem rotbraunen Lehm B auf und geht in die Fläche kontinuierlich in C über.

E Lage aus kleinen (5cm) Kieselsteinen und viel Feinkies. Liegt in braun-orange angeriegeltem Lehm. Stellenweise auch stärker verregelt. Wenig HK. Grenzen fließend.

Tentulipali Profile drawing of the east/west profile (looking south); length 7.6m; drawn as found: profile not cleaned, broken from massive stages, erosion gullies, scale 1:20, date 06.12.2001

- ① Coarse head-sized stones laid as a wall. Probable orientation of the wall: n/s. Coarse material set in clay (river gravel and broken stone). Width c. 0.7 m, Maximal depth c. 1.4m
- ② Layers of river pebbles of homogeneous size; awakens the impression of a back wall joined to ① other walls at a 90° angle. It seems to be an extension of ① and ② a court with abundant pot sherds
- ②a Similar to and belonging to ②; however, owing to the deposits of sediment before the wall only vague information about the dimensions possible.
- ③ Massive leeward area, cannot be drawn
- ④ Layer of roughly worked broken stone.
- ⑤ in front of ② deposit of burnt clay with heavy concentration of charcoal
- ⑥ burnt clay also in front of ②, however much harder in its consistence than ⑤
- ⑦ Badly disturbed area caused by the action of an erosion gully
- ⑧ middle brownish grey sandy fine gravel
- ⑨ gradually blending into ⑧: sandy fine gravel brownish grey clay heavy concentration of lime concretions; as recognizeable no pottery
- ⑩ Debris layer of burnt clay, charcoal, pottery, calcined bone

## Trench I

Spit III: rötliche Waren (bes. PRW in zwei Varianten) überwiegen,  
daneben OGW und 2 BGW; eine fragliche BRW-Scherbe

Spit IV: ebenso (ohne RBGW und BRW)

Spit V: deutlich anders: BSW, darunter ein Boden mit Spiraldekor  
BRW (ein Stück mit Sgraffito), BBW (u.a. mit Kammstrich-  
Dekor), jedoch bereits kleiner Anteil an PRW (mehr als  $\frac{1}{3}$   
der identifiz. Waren), RSW (2. Gr.-T. mindere Qualität)

FF-Behandlung  
wird ganz so  
sorgfältig wie in  
früheren Spits

Spit VI: BSW, BRW (ebenfalls größer), BBW, RSW, Anteil an PRW  
etwas mehr als  $\frac{1}{4}$

Spit VII: BSW, BRW, RSW, BBW (starker Kammstrichdekor),  $\sim \frac{1}{3}$  PRW

Spit VIII: BSW, BRW (~~etwas~~ fast  $\frac{1}{2}$ ), BBW, wenig PRW, RSW

Spit XI: BRW (mehr als  $\frac{1}{3}$ ), BBW, RSW

praktisch  
Surface: ~~alle~~ Waren vertreten, PRW überwiegt,  
dasselbe gilt für die - gestörten - oberen Schichten  
bis ca. 25 cm u. OF.

Finds, Haldipali, Tentulipali, and survey finds, 2002

Dear Rath,  
herewith I submit to the Orissa State Archaeology finds from the aforementioned places.

Yours truly,

*Paul Yule*  
Dr Paul Yule

Enclosures:  
three boxes of finds  
list of finds from sites surveyed in 2001  
list of finds from Haldipali from 2001  
list of finds from Tentulipali from 2001  
copy plans and profiles from Haldipalai  
copies of find slips from 2001  
ware slips from 2001

Begehung der Fundstelle: Vor vier Jahren hat ein Student von Dr. Behara ein Survey am Unterlauf des TEL durchgeführt und u.a. am Nordufer des TEL in der Nähe des Dorfes

HADI PALI Keramik aufgefunden; u.a.

schwarz-rote Ware aus der Eisenzeit.

Das Nordufer des TEL ist hier geprägt durch einen ca. 8m hohen Steilhang, der von mehreren „Gullys“ unterbrochen wird.

An mindestens drei benachbarten Gullys

liegt auf der Oberfläche zahlreiche

Scherben auf. Während des Messbereichs

nahezu eben ist, liegen die Keramik-

anfeisenden Gullys auf einer leichten

nach allen drei Seiten flach an-  
laufender Anhöhe. Diese erstreckt sich  
in Ost-West Richtung um ca. 400 m, von  
Hilken nahe Norden um ca. 150 m.

Diese Anhöhe wie auch der weitere Ufobereich  
ist mit dünnem Gras, einzeln stehenden

Büschen und Bäumen bewachsen und wird als

Weide für ~~die~~ Wasserbüffel extensiv ge-  
nutzt.

Jobs

Bei einer eventuellen Begehung wird der mittlere der drei größeren Gullies für eine Sonde ausgewählt und als „SECTOR 1“ bezeichnet. Der Zustand vor der Ausgrabung wird fotografisch dokumentiert.

Dieser Gully ist trichterförmig ausgewaschen und hat an der Kante des Steilhangs eine Breite von ca. 18 m. Die Sonde soll in der Osthälfte des Trichters durchgeführt werden.

Im Dorf treffen wir den „Vorsteher“ und ~~versteht~~ er sagt zu, für morgen 7.30h fünf Arbeiter bereit zu stellen.

Für die ca. 50 km bis nach BOLANGIE benötigen wir mit dem Auto fast 1 1/2 h.

Mittwoch, 7. 11. 2001

Astra, Peter, <sup>Jagadev</sup> # 5 einheimische Arbeiter TN

08<sup>00</sup> - 13<sup>00</sup> h Zeit

Job

Als Fläche für die Sondage wurde die Osthälfte des halbkreisförmigen Trichters ausgesucht. Entlang der Oberkante des Trichters wurde eine polygonale Grenze abgesteckt, die möglichst nahe zum erdierten Bereich liegt.

Dieser Bereich wird durch durch Wasser-  
rinnen in drei nahezu gleich große  
Blöcke getrennt.

Zunächst wird der Scherbenbelag auf  
der Oberfläche aufgesammelt, die ~~Ober-~~  
<sup>das</sup> fläche anschließend vom lockeren Sediment  
auf der Oberfläche abgetragen.

In zwei der drei Abschnitte wird der  
durchwühlte Oberboden 0,1 m tief  
abgegraben.

Dann wird die Bodenstruktur mit

einem Brecheisen gebrochen. Dabei  
zerspringt der Boden in über faust-  
große Brocken mit sehr hoher  
Bindigkeit. Dieser Boden ist mit  
Steingans ~~durchsetzt~~ und wenig Sand  
durchsetzt. In dieser Erdlage finden  
sich nur wenig stark erodierte  
finger- nagel- große rot gebrannte  
Scherben.

Dagegen waren die ~~Scherben~~ das Auf-  
kommen an Scherben, die auf der  
Oberfläche auflagen sehr groß: immer  
hin zwei große Fundtüten. Die  
Scherben wurden getrennt in Sand-  
scherben, Wandscherben und Splitter.  
Die Splitter wurden aussortiert und  
verbleiben auf einem Haufen vor Ort.

Jaysakar, Petra, Peter, 6 Arbeiter TN  
07.45 - 13<sup>00</sup> h / 15 - 17 h Zeit

Abschnitt 1 und 3 wurden jeweils  
um einen Abzug von 0,1m abge-  
tieft. Der Bozzen bestand aus stark  
verhärtetem, bindigen mit Hängen  
durchsetzten Schwemmsediment,  
in dem stark kantensodete, zumeist  
nur fingerknopfgroße Scherstücke  
und fest verbunden waren.

In Abschnitt 1 wurde eine Flur Stelle  
begrenzt von Bruchsteinen und einem  
gebrannten Ziegel und -fragmente  
festgelegt und dokumentiert (Digi-  
Foto / Zeichnung 1:20).

Am Nachmittag tiefte Jaysakar mit  
vielen Arbeitern eine 2x2m große  
Sonddage in Abschnitt 3 durch.

Die Maßnahme HALDI PARI, Sektor 7, begann mit der Begehung des Fundplatzes am 4. NOV. 2001 mit Teilnahme von Dr. Tharadeep Bhara. Die Grabungsarbeiten begannen am 7. 11. und endeten am 13. 11. 07. Am darauffolgenden Tag wurden die Profile in Nord- und Westprofile dokumentiert, am 15. und 16. 11. die Pläne und die Keramik bearbeitet. Am 17. 11. wurde die Grabungsstelle wieder verfüllt. Der Fundplatz ist während einer Begehung vor vier Jahren von einem Studenten von Dr. Behara entdeckt worden.

Ablauf.

Dr. Tharadeep Bhara  
11.11.07

## Gelände

Das Nordufer des TEL südlich der Ortschaft HALDI PARI ist geprägt durch einen 8 m hohen <sup>↗</sup> ~~Steilhang~~, der an mehreren Stellen durch Wassererosion in teilweise tiefe Schluchten oder trichterförmigen Auswaschungen unterbrochen wird. Die Oberfläche weist nur geringe Höhenunterschiede auf. Dieser Uferbereich ist auf einer Breite von ca. 120 m bis zum Rand der bel. Felder mit einzeln stehenden Bäumen und Büschen besamsetzt und wird als Weide für Vieh genutzt.

x' annähernd senkrecht abfallender  
Prallhang

Vor Beginn der Erdarbeiten wurde in  
<sup>Ab schnitten</sup> drei Abschnitten, die sich durch Kreuze  
natürlich voneinander teilte, der auf der  
Oberfläche aufliegende Scherbenbelag auf-  
gesammelt. Danach wurde auf der ge-  
samten Fläche der lockere, leicht durch-  
wurzelte Oberboden mit den hier bei der  
Feldarbeit verwendeten Hacken abge-  
tragen. Da nach diesem Abtrag bis auf  
einen schon auf der Oberfläche sichtbaren  
gebrannten Ziegel keine <sup>Struktur</sup> erkenn-  
baren ~~Struktur~~ war, wurde ein Abtrag  
von 0,1 m in den Abschnitten 1 und  
3 abgetragen. Dabei erwies sich der  
Boden so bindig, daß er mit Bock-  
stangen gelöst werden mußte. Da  
optisch der Boden völlig strukturlos, ohne  
erkennbare unterschiedliche Erdschichten war,  
wurde jeweils ein <sup>kurz</sup> Abtrag von ca. 0,1 m  
abgetragen, das entsprechende Niveau

Vorgehens-  
weise:

planiert, mit Leisigbäumen gepflanzt. Diese Abfälle wurden bis auf den untersten völlig steilen Schuttkegel abgeteilt. Die Scherben aus diesen Abfällen wurden getrennt voneinander geborgen, die Nord- und Westprofile zeichnerisch und fotografisch dokumentiert.

### Ergebnisse:

In Abschnitt 1 wurde eine aus einem gebannten Ziegel und Adorf-Bruchstein Fundstelle, innen mit Lehm ausgegossen und ausgestrichen, festgestellt. In Abschnitt 3 und Tranch 1 eine Kalkschicht aus faustgroßen Grobkies festgestellt. Beide Befunde sind mit hoher Wahrscheinlichkeit subrezent.

19c.  
Westprofil

In der Erdlage unterhalb des durchwurzelten Oberbodens wurden zahlreiche, zum Teil nur fingerhaken große Leisten, sind völlig erodiert und verschifften

Druckanten geborgen. Unterhalb dieser  
Erdlage wurden dagegen ~~sehr~~ großer  
fragmentäre Schalen und ein verdrücktes  
Gefäß geborgen (siehe Tabelle 1, Detail-  
zählung Nr. 1, Sp. 2 und 3 und 4).  
Der Boden, in dem die Funde einge-  
bettet waren, war völlig stark locker, und  
seine Unterteile in einem Bereich von  
0,2 m völlig verschlammten.

Da keinerlei Befunde erkennbar waren  
und es sich offensichtlich um verschlammte  
Material handelte, wurde die Unter-  
suchung nicht flächig ausgedehnt.

Fundstelle am SW-Ufer des  
 RAHUL. Die antike Siedlungs-  
 fläche erstreckt von nördlich  
 des Tempels des modernen  
 Dorfes im N bis weit südlich  
 des Dorfes entlang des extrem  
 stark durch Erosionsformen  
 gegliederten Hochufers des RAHUL.  
 Als Grabungsplatz wurde  
 ein im W und S von großen  
 Erosionsrinnen umgebener Sporn  
 ganz im S der Siedlungsfläche  
 gewählt, welcher Pradeep zufolge  
 die höchste Stelle des Siedlungs-  
 höfens ist. Der Sporn ist etwa

12 x 8 m groß und  
 besitzt eine nahezu  
 ebene Oberfläche,

welche mit Gras und  
 einzelnen Büschen bewachsen  
 ist. Soweit die Abbruchkanten

Lehm mit Einschlüssen von Keramik, Rotlehm, kleinen Kieseln und Schlacken. Die Scherben sind meist kleinstückig, es treten aber bereits erste große, in die Tiefe reichende Stücke auf. Befunde sind nicht erkennbar.

Def.:

- Acs Höhenbezugspunkt dient die NO-Ecke des Areals
- Die Einzelmessung von Funden erfolgt in Metern nach N und nach O von der SW-Ecke ausgehend

Donnerstag, 29.11.2001

Pradeep, Joachim, 6 Arbeiter

700 - 1200 / 1400 - 1700

Da bei dem Versuch, die oben erwähnten Scherben zu bergen

von den Arbeitern bereits tiefere  
Löcher gegraben wurden und  
so dicht unter der Oberfläche  
kaum klare Befunde zu erwarten  
waren, wurde auf die Fein-  
präparation des Planums  
verzichtet und direkt mit  
einem weiteren künstlichen  
Abtrag (Spit II) von ca. 10 cm  
Höhe begonnen. Nachfolgend  
wurde die in ~ 20 cm Tiefe  
liegende Oberfläche als  
Planum 1 zeichnerisch und im  
Foto dokumentiert. Im N der  
Grabungsfläche liegt ein heller,  
gelblich-brauner Feinsandiger und  
homogener Lehm. Er besitzt eine  
zeste Konsistenz und beinhaltet  
einige, meist kleinere Scherben.  
Unter Seq. No. 13 wurde aus  
dem Planum zwischen Spit II und

III eine  $^{14}\text{C}$ -Probe entnehmen.  
Im S liegt ein fester, orange-  
brauner bis roter, inhomogener  
Lehm vor. Er enthält zahlreiche  
Eisenkonkretionen und Scherben,  
Stellenweise, besonders im SO,  
sind auffallend harte, graue  
Lehmbereiche vorhanden. Bemerkens-  
wert drei von oben  
zerdrückte Pithoi (Sed. 18, 20, 21),  
zudem einige in Spitzige-  
bogene Scherben gehören dürften.  
Besonders die oberen Bereiche  
von Pithos 18 scheinen ver-  
brannt zu sein. Außerdem  
wurde eine große verbogene  
Eisennagel sowie ein klammer-  
artig gebogenes Eisenobjekt  
in Grid D gefunden (Sed. Nr.  
16, 17). Beim Abbau von  
Spitz III wurden im gleichen

Bereich etliche weitere  
~~ein~~ Eisenobjekte, meist große  
Nägel, gefunden. Spitz III (20-25  
cm) besteht aus den bereits  
<sup>2. Spitz II</sup>ercenterten Materialien.

Vermutlich liegen die Reste  
eines abgebrannten Gebäudes  
vor, wie die als Baunägel  
auffindbaren Eisenobjekte, der  
Brandschutt und die in situ  
zerdrückten und angebrannten  
Pithoi nahelegen.

Bei der Begung der Keramik  
fiel vermutlich eine Ver-  
mischung der Scherben der  
separat geborgenen Pithoi  
und der sonstigen Scherben  
stark.

Freitag, 30.11.2001

zwei Grids tiefer

Zeit

730-12<sup>15</sup> / 14<sup>00</sup>-17<sup>15</sup>

Jobs:

Die nach Abtrag von Spit III

30

in ca. 25 cm Tiefe liegende

Oberfläche wurde feinpräpariert

und als Planum 2 zeichnerisch

und in Foto (Grid C) dokumentiert.

Im NO erscheint weiterhin

homogener, gelblich-brauner Lehm.

Im S (Grid D+C) dagegen wiederum

als Brandschutt deutbares, inhom-

ogenes orange-braunes bis rötliches

Material. Es zeichnet sich ein

weiterer Pfthos (33) ab, so

dass man vier (eventuell

sogar fünf) solche Gefäße

in eine Reihe liegen. \*

In Anbetracht der kurzen zur

Verfügung stehenden Zeit und

dem Ziel, eine Stratigraphie

zu erarbeiten, wurde beschlossen,

lediglich in zwei Grids tiefer

zu gehen. Da die Bergung der  
Pithei ohnehin ein Tiefergehen  
nötig machte, fiel die Wahl  
auf die Grids C und D im S.

Beim Abbau von Spst IV

(75 - 80 cm) wurde schwär-  
liches Material gefunden,

auf welches abgebaut wurde.

Erstmals bestimmt somit ein

Befund die Unterkante eines

Abhanges. Aus Grid C wurde

dabei die <sup>14</sup>C-Probe Seq. No. 38

gewonnen. Das abgebaute Material

entspricht den obigen Beschreibungen.

~~Bei~~ Bei der Bergung der Pithei

scheinen erneut Vermischungen

innerhalb von Spst IV möglich.

---

Im Grid A hingegen liegt nun  
ein orange-brauner, inhomogener  
Lehm vor, der nur ungenau  
abgegrenzt werden kann.

Die nach Abtrag von Spit IV in  
~30 cm Tiefe liegende Fläche  
wurde als Planum 3 in  
Zeichnung und Foto dokumen-  
tiert. Es handelt sich <sup>offenbar</sup> um  
einen Fußboden. Flächig  
nachweisbar ist ein dunkelgrauer  
bis dunkel-braunroter Lehm mit  
starker Häckselmagerung  
und vielen Eisenkorrekturen,  
der an vielen Stellen schwarz-  
grau verbrannt ist. Vor allem  
im Profil ist eine dünne,  
extrem feste weiße Schicht  
feststellbar, die diesem Lehm  
aufliegt. Hierbei handelt  
es sich eventuell um einen  
Kalkestrich, <sup>wahrscheinlich aber um</sup>  
<sup>einen feinen, stark</sup>  
<sup>verbrannten Lehm aufstrich.</sup>  
Spit IV (~30-35 cm) diente  
dem Abbau des beschriebenen  
Fußbodens. Dieser Befund er-

hörtet die Deutung als Überrest  
eines abgebrannten Hauses.

Der im NW liegende Bereich  
mit hellen, gelblichen Lehm  
wurde jeweils ohne Trennung  
mit abgebaut.

Unter dem Fußboden liegt  
ein heller, gelblich-bräunlicher  
Lehm mit etlichen Eisenkonkretionen.

Er ist leicht sandig und enthält  
hier einzelt Holzkohle und kleine  
Rotlehmbröckchen sowie einzelne  
Scherben. Es sind keine Pfosten-  
löcher oder sonstige Befunde  
erkennbar. Spitz VI (35-40 cm)  
dient dem Abbaudes oberen  
Teils dieser Schicht. Hierbei  
wurde die 14(-Probe Seq. No. 44  
genommen. Da keine abrupten  
Materialänderungen zu erkennen  
waren, wurde mit dem Abtrag

Von Spit VII (40-50 cm) fort-  
gefahren. Nach unten zu  
wird der Lehm flächiger etwas  
rötlicher und ist auffallend fett,  
fest und zäh. Zunehmend steigt  
die Anzahl von kantig ge-  
brochenen Steinen und Fluß-  
kieseln mittlerer Größe, Rot-  
Lehm brocken und Fragmente  
von Ziegeln (??? außen orange,  
innen grau-schwarz, mit Hacks<sup>\*</sup>).  
Im W zeichnet sich eine hell-  
graue Zone ab. Erstmal  
tritt in Spit VII Black and Red  
Ware grober Machart auf.

---

\* wohl doch eher als Hotten Lehm  
anzusprechen

TN

200 1200 / 1400 - 1700

Zeit

Die in ca. 50 cm Tiefe liegende  
Unterkaute von Spit VII wurde als  
Planum 4 zeichnerisch dokumentiert.

Jobs

Planum 4

Der Großteil der Fläche wird von einem  
braungrauen Lehm eingenommen, welcher  
Einschlüsse von Steinen und HK sowie  
mehrere Rotlehmkonzentrationen auf-  
weist. Im W befindet sich eine nicht  
klar abgrenzbare Zone mit weißlich  
bis <sup>hell</sup>braungrauem Lehm mit HK, Rotlehm  
und Keramik. Ebenfalls nicht klar  
als Befund abzutrennen ist  
ein Bereich im NO von Grid C,  
wo dunkler rotbrauner Lehm  
mit HK, Eisenkonzentrationen und viel  
Rotlehm sowie einigen Scherben  
liegt. Vielleicht ~~für~~ handelt es  
sich um eine Grabenfüllung.

Sodann erfolgte eine Begradigung  
der Profile, wobei das Fundmaterial  
als Seq. No 51 geborgen wurde.  
Vermutlich kam es allerdings  
zu Vermischungen mit den  
Funden des gleichzeitig abgebauten  
Spit VII, so dass dessen Material  
leider nicht völlig geschlossener  
Komplex betrachtet werden kann.

st VIII Spit VIII liegt zwischen 50-60 cm Tiefe und ~~umfasst eine S~~ besteht aus rotbraunem, feinsandigem Lehm, welcher sehr fett und zäh ist. Er enthält Scherben, viele Eisenkonkretionen und etwas verschlackte Keramik/Rotlehm.

st IX Spit IX nimmt den Tieferbereich zwischen 60-70 cm ein. Der Boden entspricht etwa der Beschreibung von Spit VIII. Es handelt sich um einen sehr zähen, fetten ~~P~~ rotbraunen Lehm. Er ist leicht sandig und lässt beim Abtrag keine Schichtung erkennen und enthält einzelne Faustgroße Kiesel. Im NO fällt eine höhere Konzentration von Rotlehm auf. ~~Aus~~ Aus einem großen Holzkohlestück wurde die 14C-Probe Seq. No. 53 gebergan. Wegen der Zähigkeit des Lehms wurde z.T. mit großen Hacken und einer Brechstange gearbeitet, weshalb auch eine an der Unterkante von Spit IX im NO liegende Steinsetzung erst spät erkannt und somit teilweise unbeobachtet zerstört wurde. Jedenfalls aber stammen auch aus der zerstörten Zone einige Kiesel und größtstückige Scherben. Der in ca. 70 cm Tiefe liegende Restbefund wurde als ms Planum 5 zeichnerisch und im Foto

dokumentiert. Es handelt sich um eine aus  $\pm$  faustgroßen Kieselsteinen und einigen Bruchsteinen gefügte Steinpackung, welche zumindest stellenweise mehr als eine Steinlage enthält. Außerdem wurden größere Rotlehmbröckchen und etliche Scherben offenbar mitverwand. Auf den Steinen befand sich (soweit nach den Zerstörungen durch den Einsatz von schweren Werkzeugen sowie ~~der~~<sup>der</sup> schwierigen Präparation des Befundes noch erkennbar) ein <sup>vermutlich</sup> ~~vielleicht~~ künstlich aufgebrachter rotbrauner Lehm, sehr reich mit vielen Eisenkonkretionen, welcher stellenweise leicht angebrannt, direkt am C-Profil überhart verziegelt ist. Über diesem Lehm befanden sich mehrere Scherben, vor allem aber der unzerbrochene Zerteil einer Flasche, welche mit dem Hals schräg nach unten auflag. Eine Deutung als Feuerstelle scheint somit sehr wahrscheinlich, zumal der Befund räumlich recht begrenzt ist. Das umgebende Material im Rest der Fläche ist ein zäher, sandiger rotbrauner Lehm mit vielen Eisenkonkretionen und etwas Rotlehm, der somit von Material nicht von dem

Material, das vielleicht künstlich  
aufgetragenen Brandplatte zu unter-  
scheiden ist).

Spit X liegt zwischen 70 und 80 cm  
Tiefe unter der "Herdstelle". Das  
Material ist wieder das selbe  
zähe rotbraune Lehm mit Eisenkon-  
kretionen, Rotlehm und Schaben.

Der nächste Abhub zwischen 80 und  
85 cm Tiefe wurde als Spit XI  
bezeichnet und besteht aus  
völlig gleichartigem Material.

Donntag, 2.12.2001

Pradeep, Joachim, 6 Arbeiter

700 - 1700 / 1700 - 1800

TN

Zeit

Spit XII beginnt in 85 cm Tiefe, besitzt  
hier eine äußerst wellige Unterkante,  
welche im Schnitt bei ca. 90 cm liegt,  
T. aber auch 95 cm erreicht. Während  
in Grid D einfach abgetieft wurde,  
wurde in Grid C ein Laufhorizont  
sowie eine darunter liegende  
Steinsetzung beobachtet werden,  
welche die Unterkante von Spit XII  
bildet und als Raum G zeichnerisch  
und im Foto dokumentiert wurde.

In Grid D liegt ein wesentlich  
lockerer, brauner Lehm mit Sand-  
anteil, Hk, Rotlehm, kleinen Steinchen,  
einigen Faustgroßen Kieseln (wohl  
aus einer Steinsetzung gehörig?),  
Schaben und Eisenkonkretionen. Aus  
diesem Bereich die 10C-Probe Seq. No.  
14 genommen.

In Grid C wurde nach ~~dem~~ Fest- Raum G  
stellung der Steinpackung versucht,  
auf dieselbige als Unterkante von  
Spit XII abzubauen und Fotoein-  
zu präparieren. Dabei stellte sich  
heraus, dass die gefundenen  
Steine und Schaben offenbar  
zu (mindestens) zwei Laufhorizonten  
gehören. Auf einem oberen Niveau,

ca. bei 85 cm markieren einige, flächig verteilte kleine Kiesel und flach liegende Scherben ein Begrenzungsniveau. Tiefer liegend - bis zu 95 cm - wurde eine wesentlich dichtere Steinsetzung beobachtet. Sie besteht aus meist kleinen (unter 5 cm), aber auch einigen größeren Kieselsteinen sowie wenigen aber dafür umso größeren Bruchsteinen. Mehrfach sind auch übereinander liegende Steine vorhanden. Die Kiesel sind in ein sehr inhomogenes Material eingebettet. Zum Teil handelt es sich um einen rotbraunen Lehm, der wenig HK und Rotlehm enthält. ~~Die~~ Stellenweise ist dieser Lehm ebenso hart und zäh, wie in den höheren Schichten, manchmal aber auch deutlich weniger fest. An anderen Stellen befinden sich die Steine in einem lockeren, lehmigen Sand hellen Färbung. Eine Deutung als Befestigung eines offenen Platzes / einer Straße scheint wahrscheinlich, zumal mehrfach flach auf dem Steinoberkanteniveau liegende Scherben beobachtet wurden. Hinsichtlich der Funde ist zu bemerken, daß BRW mittlerer Qualität vorhanden ist, die Qualität der roten Waren steigt und mehr dunkle Scherben als zuvor auftreten.

In Grid D wurde zwischen ca 90 und Spit XIII  
75 cm Spit XIII abgetieft. Seine Unter-  
kante ist allerdings sehr schräg/wellig,  
so dass kein einheitliches Maß angegeben  
werden kann.

Nachfolgend wurde in Grid D zwischen Spit XIV  
ca. 95 und 105 cm Spit XIV abgebaut.  
Beide Spits bestehen aus bräunlichem  
bis rotbraunem Lehm mit Rotlehm, Hk,  
Scherben und kleinen Kieseln. Dies,  
sowie die Beobachtung des Profils  
deutet darauf hin, dass auch in Grid D  
ein Laufhorizont wie in ~~Grid~~ Grid C  
vorhanden war, ~~der~~ da aber unbe-  
merkt abgetragen wurde.

In Grid C wurde das zwischen Spit XIII / XIV  
ca. 90 und 105 cm liegende Material  
in einem Zug ohne Unterteilung  
abgebaut. Das Material umfasst das  
bereits beschriebene Spektrum von  
Steinlage, lehmigem Sand sowie festen  
braunen bis rotbraunen Lehm. Aus  
der Unterkante wurde die 14C-Probe  
Seq. No. 68 entnommen.

In Nachhinein erscheint der Abbau  
in einem Zug nachteilig, da dadurch  
das direkt auf der Steinpackung  
liegende Fundmaterial mit dem  
unter der Steinpackung befindlichen  
vermischt wurde. Sicher ist allerdings,  
dass sowohl die beiden ersten

Scheiben von Kabbel Ware,  
als auch das erste Stück  
qualitätvolle, rot gestrichte und  
polierte Ware erst unter der  
Steinlage auftraten.

Montag, 3.12.2001

Pradeep, Joachim, 6 Arbeiter

T.N

700-1200 / 1400-1700

Zeit

Spit XV erstreckt sich zwischen

Jobs

105 und 115 cm Tiefe.

Spit XV

Hinsichtlich des Materials ist eine deutliche Änderung zu beobachten.

Es handelt sich hauptsächlich um einen  
mitte lbräun<sup>meist weniger zäh</sup>en, recht sandigen Lehm.

Er enthält reichlich Holzkohlefritze und

Holzkohlebröckchen, recht wenig und

zudem kleinteiligen Rotlehm, kleine

Steine und einzelne Kiesel sowie

Keramik. Allerdings ist das Material

sehr inhomogen, so dass es auch

Zonen mit nur schwach lehmigem Sand

einseits ~~und~~ gibt und andererseits

solche mit dem bisher typischen, sehr

fetten und zähen rotbraunen Lehm.

In den Sandzonen wiederum

sind z.T. dünne Lehm-Linsen einge-

schaltet. Aus Grid C wurde unter

geg. No. 72 eine <sup>14</sup>C-Probe entnommen.

Tendenziell ist eine weitere Steigerung

der Keramikqualität zu erkennen.

Spit XVI liegt zwischen 115 und

Spit XVI

123 cm Tiefe. Das Material ist

weiterhin recht inhomogen. In

Grid C handelt es sich um einen

sandigen, braunen Lehm mit viel

Holzkohlefritze und äußerst kleinen

RotLehmbröckchen und kleinen Steinchen.

Er ist meist nur mittelfest, stellenweise

aber auch enorm zäh und bländig. In

diesem Lehm sind mehrere Schichten

eines Coekaren, lehmigen Sandes ein-

geschaltet. Beim Hacken platzt der

Boden daher schallig ab. In Grid D

dagegen überwiegt ein auscheinend

strukturlos, sehr zäh, rötlich-

braun, Lehm, der ebenfalls viel

Holzkohleflitz, kleine RotLehmbröckchen

und Steinchen aufweist. Zwar ist er

sandig, es fehlen aber die in Grid C

vorhandenen Sandlagen.

Bemerkenswert ist das erste Auf-

treten von Knochenmaterial im

westlichen Grabungsteil. An mehreren

Stellen fanden sich extrem stark

zersetzte, auscheinend z.T. auch ver-

brannte Knochenstücke. <sup>(Seq. No. 77-80)</sup> Wenn es

sich dann um menschliches Knochen-

material handeln sollte, so würde

die Ausrichtung der Langknochen-

stücke auf eine N-S-Orientierung

hinweisen. Wohl gemerkt fanden

sich aber keinerlei auf ein Grab

hinweisende Befunde.

In Grid C wurde die 14(-Probe

Seq. No. 75 entnommen.

um 7 Die Unterkante von Spit XVI in

ca. 123 cm Tiefe wurde als

Planum 7 zeichnerisch dokumentiert

Den Hauptteil der Fläche nimmt ein brauner, stark sandiger Lehm ein. Er ist sehr bröselig und enthält einige HK- und Rotlehmbröckchen sowie Scherben.

Im Westen findet sich zäher rotbrauner Lehm mit relativ viel Holzkohle, Rotlehm aber wenig HK, Scherben und Mangan- und Eisfällungen. Die Grenzen sind fließend. Am Südprofil fällt eine Zone mit gräulichem Sand und Feinkies auf, die zunächst als "pit 7" bezeichnet wurde, beim ~~Ausgrabung~~ nachfolgenden Abbau aber nicht als in die Tiefe reichender Befund bestätigt werden konnte.

"pit XVII" liegt zwischen 123 und 146 cm Spitz XVII Tiefe. In Grid C liegt ein mittelfester, brauner sandiger Lehm vor, der einige Holzkohle, Rotlehmbröckchen sowie etwas Knochenmaterial enthält. Lokal, etwa am Ostprofil ist der Lehm allerdings auch recht zäh. Beim Präparieren eines Rinderkiefers konnte direkt am Ostprofil ein Laufhorizont in 128 cm Tiefe noch nachgewiesen werden dunkellichere flach aufliegende Scherben, darunter auch ein "Spielstein". Der schmale noch nicht abgebaute Streifen dieser Oberfläche wurde fotografisch dokumentiert. In Grid D liegen liegt ein sehr zäher Lehm

vor, der sonst aber den für Grid C  
beschriebenen Material entspricht.  
Unter Seq. No. 86 wurde aus  
Grid D eine <sup>14</sup>C-Probe gewonnen.  
Die Unterkante des Strat XVII liegt  
in Grid D bei lediglich 735 cm.

Dienstag, 4.12.2001

Pradeep, Joachim, 6 Arbeiter

TA

7<sup>00</sup> - 12<sup>00</sup> / 14<sup>00</sup> - 17<sup>00</sup>

Zeit

Zwischen 140 und 147 cm wurde

Jobs

Spit XVIII abgetragen. Es handelt

Spit XVIII

sich um einen meist mittelbraunen,

sandigen und mit Helfesten bis bröseligen

Lehm mit Holzkohle und Schaben.

Im Osten liegt z.T. ein zäher rotbrauner

Lehm mit vielen Holzkohlebröckchen aber

wenig Rotlehm vor, da zudem einzelne

große Kiesel enthält. Mit der Seq. No.

94 und 96 wurden die ersten

Metallobjekte aus frühgeschichtlicher

Schichten geborgen (Eisenobjekt, Kupfer-

ringl. In Grid D liegt die Ohg-

Kante des Abhanges bei 135 cm.

Die Unterkante wurde als Planum

Planum 8

8 in 147 cm Tiefe zeichnerisch und

als Foto dokumentiert. Den Großteil

der Fläche nimmt ein mittelbrauner,

stark sandiger Lehm ein, der zahlreiche

Einschlüsse von kleinstückiger Holzkohle

und Rotlehm enthält. Aus ihm wurde

die 14C-Probe Seq. No. 100 entnommen.

Im NO zeichnet sich ein Fleck

gelblichen Sandes ab, der jedoch

nicht als Grube identifiziert

werden kann. Lokal finden sich

Bereiche mit zähem, sandigen

Lehm rotbrauner Farbe mit viel

Holz Kohle und Rotlehm. Im SW wurde eine Lage kleine Kiesel aufgedeckt, die von einem orange verziegelten Lehm überdeckt werden. Meist ist dieser Lehm weich und staubfein, an manchen Stellen aber auch härter verziegelt. Die Angeziegelten Bereiche gehen sowohl in der Fläche, als auch in der Tiefe fließend in den beschriebenen unversehrten Lehm über. Eine Deutung als Feuerstelle auf einem antiken Laufhorizont liegt nahe.

St IX Zwischen 147 und 155 cm wurde Spitz IX abgetragen, wobei in Betracht der knappen Zeit beschlossen wurde, lediglich in Grid C weiter zu arbeiten, um eine möglichst große Tiefe zu erreichen. Es handelt sich um recht inhomogene Sedimente. Meist liegt stark sandiger, mittelbrauner Lehm vor, der sehr weich und bröselig ist. Er enthält viel Holz Kohle Flitter, aber wenig Rotlehm. Daneben existieren Zonen mit lehmigen Sand. Auffallend sind einzelne Kiesel und große Bruchsteine, vor allem aber die große Zahl großstückiger Scherben. St XX Spitz XX umfasst den Tiefenbereich zwischen 155 und 160 cm. Das Material

ist identisch mit dem des Spit XIX,  
wobei erneut die vielen großstückigen  
Schalen hervorzuheben sind.

Auch der Abhang Spit XXI zwischen Spit XXI  
160 und 170 cm findet in einem  
leichtartigen Sediment statt.

erneut trat ein relativ großes  
Keramikenensemble zu Tage. Außerdem  
wurden mehrfach Knochenreste ge-  
funden, deren Erhaltung aber extrem  
schlecht ist, sodass teilweise eine  
Zuordnung nicht möglich war. Vor allem  
im Süden der Fläche <sup>flach liegende Schichten</sup> deuten einige

Liesel, größere Rotlehmbröckchen und  
Holzkohlreste einen Laufhorizont  
in der Unterkante des Abhangs in

170 cm Tiefe an. Aus dem Spit wurde  
die 14C-Probe Sequ. No. 109 geborgen.

Spit XXII liegt zwischen 170 und 175 cm Spit XXII  
Tiefe. Es handelt sich weiterhin um einen  
weich bis sehr weichen, stark sandigen,  
raunen Lehm mit recht vielen Holzkohle-  
littern und wenigen, aber dafür größeren  
Rotlehmbröckchen. Wiederum ist kaum zu-  
gehöriges Knochenmaterial enthalten.

Daneben gibt es aber auch Zonen mit  
reinem Sand oder solche mit  
verbackenem, gelblich-hellbraunem  
Lehm (vorwiegend im Norden/Nordosten).

In der Unterkante von Spit XXII auf -175 cm  
liegt ein homogenes, bräunliches Lehm

Vor, welche von gelblichem Sand-  
schichten durchzogen wird. Er enthält  
relativ wenig Holzkohle und Rotlehm,  
einzelne Steinchen und großstückige  
Schalen. Bei 0,5 m Nord / 2,6 m Ost  
fällt eine ca. 50 cm große Konzentration  
mit viel Holzkohle, Rotlehm, einzelnen  
Knochen und Zonen mit gelblichem  
Sand auf, wobei es sich aber vermutlich  
nicht um eine Grube handelt. (Eine  
Planungsdocumentation wurde  
wegen Zeitmangels nicht vorgenommen.)

Mittwoch, 5.12.2001

Pradeep, Joachim, 6 Arbeiter

TV

700 - 1200 / 1400 - 1700

Zeit

Spit XXIII liegt zwischen 175 und 185 cm tief. Das Sediment entspricht

Jobs.

in seiner Zusammensetzung dem

Spit XXIII

Spit XXII, es fällt aber auf, dass

wesentlich weniger Keramik

enthalten ist als in den vorherigen

~~Abhängen~~ Abhängen.

Gleiches gilt für den Abhang

Spit XXIV

Spit XXIV zwischen 185 und 200 cm

Tiefe.

Zwischen 200 und 215 cm wurde

Spit XXV

abschließend Spit XXV abgetieft.

Es handelt sich um einen mittelbraunen,

stark sandigen Lehm mit wenig

Holz Kohleflitta, der äußerst weich

und bröckelig ist. Aus diesem

Spit wurde die 14C - Probe Sequ. No.

118 entnommen.

Mit Erreichen der Tiefe von 215 cm

wurden die Grabungsarbeiten für

dieses Jahr eingestellt, ohne den

gewachsenen Boden erreicht zu

haben.

Parallel zum Abtiefen der letzten

Abhänge wurden die Profile

erneut gereinigt und mit der

Dokumentation des Süd- und des

Westprofils begonnen.

Um die Grabungsstelle in den bestehenden  
GPS-Plan einhängen zu können, wurden  
die Eckpunkte A-D sowie der  
Mittelpunkt I per GPS gemessen.

Abends Grabungsfest am Rahleufer  
mit Hammelbraten und Rum.

Zeit

Die zeichnerische Dokumentation  
aller vier Profile wurde beendet.

Außerdem wurden Fotos mit verschiedenen  
Blendern der Profilwände angefertigt.

Zusätzlich wurde der Endzustand  
der Grabungsfläche fotografisch  
festgehalten.

Der Boden der Grids C und D wurde  
mit einer dünnen Plastikfolie aus-  
gelegt, welche mit modernen gestempelten  
Ziegelsteinen besetzt wurde.

Außerdem wurden weitere Plastik-  
stücke ausgestreut. Die Grabungs-  
arbeiten wurden nach der Entlohnung  
beauftragt, den Schnitt am morgigen  
Tag mit dem Abraum zu verfallen.

Freitag und Samstag, 7-8.12.2001

bs Nachbereitung der Grabung. Sämtliche Scherben werden gewaschen und alle Fundzettel dupliziert sowie eine Fundliste erstellt.

Alle Knochenfunde sowie die <sup>14</sup>C-Proben werden ausgesondert und Pradeep Mohanty zur Bearbeitung in Indien übergeben. Die weiteren Kleinfunde werden gesammelt und separat verpackt, während die Keramikensembles nach aufsteigender Sequ. No. geordnet werden. Die Keramik Sequ. No. 119 ging beim Waschen verloren und ist wohl zu anderen Material gegeben worden.
